The ACSONE Team Handbook is the central repository for how we run the company. As part of our values of continuous improvement and collaboration, all employees and external collaborators are welcome to suggest improvements or open discussions.

Please make a [merge request](#) to suggest improvements or add clarifications. Please use [issues](#) to ask questions.

WHO WE ARE

We are software engineering professionals. With a proven track record going back over the last 20+ years, we take pride at developing durable and reliable software systems for our clients to help them achieve their goals.

In addition to a background in information technology, engineering or consultancy, our experts have accumulated strong competencies in project management and software development methodologies. These skills are the keys with which we build and deliver advanced software systems that are intuitive, flexible, and reliable.

Quality and openness being at the core of our values and design principles, our solutions are naturally based on Open Standards and Open Source technologies.

1.1 Sustainability in software engineering

At Acsonone we know software systems always live longer than originally expected. We therefore believe our software must be sustainable in itself: open, interoperable, easy to maintain and extend, and overall a good citizen of your IT portfolio.

We also believe software must sustain your business, not the other way around.

When you invest in a software development or implementation project, you want to make sure the result will bring the expected benefits. You also want to have a future proof solution that preserves your freedom.

We share these objectives with you, and to achieve them we work along a few key values and design principles:

- Collaboration
- Open source
- Open Architectures and Open Standards
- Quality
- Commitment and trust

1.2 Collaboration

We take a highly collaborative approach to projects because a sound understanding of our customers business and their challenges leads to a shared vision for the best results. We strongly believe that a mutual feedback loop between IT and business stakeholders during the whole project lifecycle is key to success.

To this end, the initiation phase will allow us to understand the business context and objectives of the project, challenge assumptions, and select and recommend the adequate technical solutions. During project execution, we favour agile methods which integrate business stakeholder into the project team and encourage frequent feedback.

1.3 Open Source

At Acsonone we believe that working with open source technologies brings direct benefits to our customers in a variety of domains. Cost savings often come to mind as a reason to select open source. While it is true that modern open source solutions are extremely cost effective compared to proprietary alternatives, we think freedom and quality benefits are even more important.

Open source software often features superior technical architectures, which derive from the very need for successful open source components to be highly modular. Providing excellent implementation of industry standards, open source libraries and tools provide robust foundations for our projects.

Freedom is at the heart of open source. With access to the source code, you have full control, should you desire to work in another way. Source code is therefore an integral part of our deliverables.

We want you to continue working with us after the first project because we deliver quality, not because you are locked-in with our solution.

1.4 Open Architectures and Open Standards

Source code is the ultimate freedom. To leverage it however, you need adequate skills that you may not want to acquire or source. So we also enable your freedom through open architectures and open standards.

Data you produce are extremely valuable and must therefore be readily available for direct use, transformation or reuse in other systems. To enable this, we strive to create architectures that are interoperable and easy to integrate in your information systems landscape. Featuring standard-based interfaces and data formats, the systems we build for you will be good citizens and cooperate nicely with your other applications.

1.5 Quality

In accordance with our strong belief in delivering consistently high quality results in every engagement, Acsonone is certified ISO 9001-2008. This important certification is the internationally recognized and respected standard for the quality management system of organizations in accordance with the International Standards Organization (ISO). It is the basis of our continuous improvement practices. Our team applies certified processes and industry best practices to every project to ensure our customers benefit from the long-term value and return on investment that high quality work delivers.

1.6 Commitment and trust

We are proud to commit on results. After the project initiation phase, when the objectives and constraints are clear, we are more than happy to commit on results. So the quality you expect comes without budgetary and planning surprises.

PRACTICAL INFORMATION

In this section, you'll find some practical information on the life at Acsoné.

2.1 Phone List

2.2 Using the Phones

We have user manuals for our IP phones.

- Snom 300
- Snom 370
- Nortel/Avaya 1120e

Our phone system comes with a companion software providing several interesting features, such as sending faxes and triggering calls from your PC (click-to-call). It is called *Wazo Client* (you need at least version 17.16).

Note: Wazo Client seems to be unmaintained though, so if you really needed its features, get in touch so we can discuss your requirements.

2.3 Credentials

We want to avoid the proliferation of passwords as much as technology permits.

We have two ways to identify users (two sets of login/password):

- The domain password which is used to access our internal resources (file server, openerp, vpn, etc)
- A Google account which is used to access your mailbox, but also other services secured with OpenId (such as plan.io, our issue tracking system)

To change your *domain password* you can either:

- visit <https://bruds.local.acsone.eu/cgi-bin/change-password>
- or, if you are using a Windows machine that is part of the ACSONE domain, the usual ctrl-alt-delete + change password should work.

Should your domain password become locked, it may have expired; first try to change it; if that fails, call for help.

To change your *Google account*, follow instructions at webmail.acsone.eu.

Internal certification authority

Several internal resources are secured using digital certificates. We use our own local certification authority to create such certificates.

To avoid warnings from your web browsers you should install the following certificate (.der) as a trusted root certification authority in your web browser and operating system.

On Windows, double-click on the downloaded .der file. Then click Install Certificate and place the certificate in the Trusted Root Certification Authorities store. Using Firefox, go to Preferences/Options > Advanced > Encryption > View Certificates > Authorities > Import.

If you need Acsonesigned certificates for development purposes, get in touch.

2.4 VPN

You can access our internal network using OpenVPN.

The credentials are your usual login and password for the ACSONE domain (the same as for brufs, luxfs).

DO NOT DISTRIBUTE: The files below are strictly restricted to Acsones personnel and authorized partners.

On **Windows**, you can simply use our custom OpenVPN setup 2.3.18.0 which installs a correct configuration automatically. Works with Windows 7 and later.

For **other platforms**, we provide the client configuration files and certificates.

To use it, `openvpn --config acsone-bruvpn-client.ovpn` is probably a good start, but we strongly advise to read [some documentation first](#).

On **Ubuntu Desktop**, `sudo nmcli connection import type openvpn file ~/Downloads/acsone-luxvpn-client.ovpn` should register the connection in Network Manager. After that, open settings, then configure your user, and check Use this connection only for resources on this network.

2.5 Applications

2.5.1 E-mail

We use GSuite for e-mail. It is available at <http://webmail.acsone.eu>.

2.5.2 Chat and video conferencing

[Google Chat](#) and [Google Meet](#) are our preferred chat and video conferencing systems.

Using Google Meet, you can invite external participants to a video conference. A Google account is not required to participate. Google Chrome and Firefox browsers are supported. Google Meet also provides a phone number for participants to join.

2.5.3 Odoo

Odoo is the Acsone ERP.

It is available at <https://acsone.eu/web>.

It is used for:

- timesheets
- expense notes
- holiday requests
- customer invoicing
- financial monitoring of projects
- accounting
- authoring the <https://acsone.eu/> website.

2.5.4 plan.io

plan.io, is our main project management system.

It is available at <https://acsone.plan.io/>.

The main plan.io feature we use are

- issues, to track all kind of tasks on projects (features, bugs, tasks).
- milestones, to plan and organise iterations.
- wiki, to serve has an entry point to all project documentation that does not fit in the source code repository.
- crm, to automatically create and track issues from e-mails send by the customer.

Note: Although plan.io can host git repositories for each project, we use it to replicate the main git repository from *gitlab* to enable cross-referencing between git commits and issues.

2.5.5 GitLab

GitLab, is the system we use to collaborate on source code.

Note: Although GitLab offers issue tracking and wiki features, we currently do not use them, and use *plan.io* for that.

It is available at <https://gitlab.acsone.eu/>.

2.5.6 GitLab CI

GitLab comes with a [continuous integration and deployment mechanism](#). This is basically a system through which you can run any kind of automation in reaction to events in your code repository such as code changes, git tags, etc.

It is configured using a file named `.gitlab-ci.yml` at the root of the repository. You can learn about it in the [.gitlab-ci.yml reference](#).

We manage a kubernetes cluster of GitLab runners on which you can run your jobs.

Typical nodes have 8GB to 16GB RAM and 4 to 8 CPUs. They have 1Gbps connectivity to the internet.

By default each job is allocated approximately 1 CPU and 2GB RAM. If your jobs need more resources, you can [request them with environment variables](#) in your `.gitlab.yml`, such as `KUBERNETES_MEMORY_REQUEST` and `KUBERNETES_MEMORY_LIMIT`.

The jobs run on a default Ubuntu container image. To avoid relying on specifics of that image, you are highly encouraged to explicitly specify the image to use with the `image` property in `.gitlab-ci.yml`.

Jobs run in that container with a non-privileged user named `gitlab-runner`.

The [GitLab CI cache mechanism](#) is usable.

To build container images, [use kaniko](#).

To make sure you obtain runners with specific properties, you can use the following tags in your job declarations:

- `odoo-8.0,,odoo-14.0`: have a shared `pip` cache and `git-autoshare` cache pre-mounted.
- `acsone-lan-lux` to make sure your job runs at ACSONE Luxembourg (in case we deploy runners elsewhere in the future). This is useful for deployments to customer sites where the source IP is important.

If you have project specific requirements that can't be satisfied with this cluster, get in touch to discuss them. It is for instance possible to deploy runners at customer sites or on dedicated machines if needed and dedicated them to specific projects.

2.5.7 File Server

The main file server used to archive company documents.

It is available as a Windows share at `\\luxfs\share-bru` and `\\luxfs\share` and contains the following main directories:

Sales/Bid Management The work directory to prepare customer proposals.

Clients All customer documents that commit the company must be archived here.

Prospects All customer documents that commit the company with regard to prospective customers must be archived here. When a prospect becomes a customer, the content of this directory must be moved to `Clients`.

Suppliers and Partners All supplier and partner documents that commit the company must be archived here.

Human Resources HR Related documents.

Marketing Gather the marketing assets

Delivery A work directory to archive project documentation. Note project documentation that is shared with the customer is also stored in [plan.io](#). In case we use the Customer's infrastructure for sharing documents with the customer, the [Project Manager](#) must ensure a copy is also stored on our File Server, so deliverables are preserved after the project is finished.

Other top level directories should contain a README explaining their purposes. If unclear, please raise an issue, so the README can be added/elaborated.

Note: We also have access to Google Drive and Google Docs. This tool is very efficient for collaboration on documents, and its use is encouraged for that purpose. It must however *not* be an archival medium: stable or published versions of documents must be stored in the *File Server* or *plan.io*.

An exception to this rule is documents for which we need long term collaboration and easy access from a browser. These documents can be stored in Google Drive, provided they are linked from an archival location (eg this handbook, plan.io, etc).

These rules are meant to avoid documents become lost or inaccessible, or difficult to discover.

Google Drive *must not* be used as a file exchange mechanism for temporary files, in order to avoid exploding storage quotas. For that use the Temp directory on the file server, or a file transfer tool such as <https://send.firefox.com>.

2.6 ICT Help

Should you have any issue with our ICT infrastructure, you have several options:

- Open a ticket on the plan.io project [ACSONE - ICT Helpdesk](#).
- Send an e-mail to ict-helpdesk@acsone.eu (which will open a ticket automatically)
- In case of urgency, call Philippe Schmidt, Stéphane or Jean-Christophe.

As always, do not hesitate to make improvement suggestions.

2.7 Offices

We have offices in Waterloo (Belgium), Kehlen (Luxemburg) and Liège (Belgium). [Addresses](#) can be found on our website.

We have an open door policy (and very few doors). Open spaces may be noisy at times and distracting at times. Please use the available meeting rooms if you have long and/or animated calls/meetings/discussions.

Coffee, tea, water is available for free.

As for everything else at Acsones, should you have suggestions on how to improve the office environment, do not hesitate discuss it openly.

More specific information about our respective offices is available below:

2.7.1 Waterloo Office information

Address:

Waterloo Atrium Drève Richelle 167/2 B-1410 Waterloo

In case of emergency

- STAY CALM
- STOP IMMEDIATELY YOUR ACTIVITY
- DO NEVER USE THE ELEVATORS
- GO AS QUICK AS YOU CAN TO THE NEAREST STAIRCASE OR EMERGENCY LADDER
- FOLLOW THE GREEN PICTOGRAMS
- GO TO THE ASSEMBLY POINT

The assembly point is situated : in the garden, at the back of the office

Domestic procedures

Waste storing:

- Tri sélectif des déchets
- Afvalsortering

2.7.2 Kehlen Office information

Address

22, Zone Industrielle Kehlen L-8287 Kehlen Luxembourg

In case of emergency

- STAY CALM
- STOP IMMEDIATELY YOUR ACTIVITY
- DO NEVER USE THE ELEVATORS
- GO AS QUICK AS YOU CAN TO THE NEAREST STAIRCASE OR EMERGENCY LADDER
- FOLLOW THE GREEN PICTOGRAMS
- GO TO THE ASSEMBLY POINT

The assembly point is situated : at the entrance of the parking, near the road (no dedicated sign yet)

Domestic procedures

Waste storing: we sort paper, glass and plastic bottles. Use the different buckets. The offices are cleaned twice a week; please facilitate the job of the housekeeper by having your desk as clear as possible.

2.7.3 Liege Office Information

Address:

Quai Banning, 6
4000 Liège
Bureau 13

Please find hereunder the access map to our new office: [Itinéraire Liège vue aérienne](#)

2.7.4 WIFI

We have WIFI access points with internet access for guests.

Waterloo

SSID: ACSONE-WAT

Password: ACSONEGUEST

Luxemburg

SSID: ACSONE-LUX

Password: ACSONE-GUEST

Liège

SSID: ACSONE-LG

Password: ACSONE-GUEST

SALES AND SOLUTIONS

Acsona is specialized in 4 solutions areas (also known as business lines), all based on Open Source and Open Standards:

- ERP Solutions
- Content and Document Management
- Digital Business Reporting
- Bespoke Business Applications

3.1 Roles

3.1.1 MarCom Officer

Scope

In the current context, the company needs one MarCom Officer.

The objective addresses two distinct and correlated activities:

- Marketing activities to **understand the market** and **generate leads** for the sales team
- Communication activities to assess the **company image** in the market and **communicate relevant information** to the market.

There will be a strong relationship and synergy with Internal Communication.

Roles & Responsibilities

He will work mainly with the CEO, *Solution Owners*, *Account Managers* and *Business Development Officers*. However, to better understand the Acsona offering and business and contribute to the provision of content, he will remain in close relationship with the project staff.

More specifically, the MarCom Officer will discuss with the *Solution Owners* about:

- Solutions positioning
- Market targets
- Distribution channels, including partners
- Pricing strategy
- Marketing and communication plan, including budget

To assess with the *Account Managers* and *Business Development Officer* :

- Value proposition of key proposals (before actually tendering)
- Visibility-enhancing actions (targeted per segment, per Business Line, per specific offering)

- Sales-oriented actions related to a specific opportunity or customer (eg a bg account)
- Implementation of the marketing and communication plans:
 - Content
 - Target
 - Frequency
 - Media and communication channels

And also:

- Determine and validate the budget with the *Management Committee*
- Launch, follow up and analyse market surveys
- Define and organize marketing and communication tactics
 - Web site and social networks
 - Brochures and multi-media collaterals
 - Events
 - Campaigns
 - Advertisement
 - Goodies
- If appropriate, maintain the relationship with PR agencies

Whos who

Person to be hired gathering experience, creativity, autonomy and production capacity. This person should be empowered by Acson management.

Deliverables

These are the main deliverables for the role:

- Yearly Marketing and communication plan for the whole company for the Business Lines and the corporate image
- Quarterly updates of the MarCom plan
- Quarterly marketing activity report, including budget
- Reports from marketing surveys
- Contribution to Business Lines Business Plan
- Marketing Assets/materials (tactics) implementing the MarCom plan like:
 - Modern and up-to-date company website and possibly correlated (mini-)websites/blogs
 - Landing pages for events and marketing campaigns
 - Content to be published on the social networks (LinkedIn, Tweeter, Facebook)
 - Content/articles to be published in papers, magazines or specific medias
 - Dynamizing the social networks
 - Company assets related to offerings and projects (use cases, snapshots, videos)
- Marketing campaign follow up in Odoo

3.1.2 Solution Owner

Scope

Each solution has one Solution Owner.

Roles & Responsibilities

- Devise, document and evolve the BL solution
- Consolidate the BL business plan: * Marketing plan * Budget
- Steer the lifecycle activities (products, frameworks, business functionality, etc.)
- Support sales activities
- Support project activities
- Support support-and-maintenance activities

Whos who

- ERP Solutions: sbi
- Content and Document Management: ccs
- Digital Business Reporting: jpd
- Bespoke Business Applications: jcc

Deliverables

- BL Business Plan (contribution to corporate BP)
- Architecture, blueprint, documentation, training material of the BL solution [as applicable]
- Marketing materials
- Lifecycle and evolution plan
- Risk analysis
- [quarterly follow-up report]

Todo: Why brackets above?

3.1.3 Account Manager

Scope

There is always one and only one account manager per Customer.

For customer that meet the following conditions, all the tasks and duties described below are applicable. The conditions are:

- Threshold of yearly turnover: 50 k€, OR
- Recurring business experienced or expected, OR
- Permanent staff at Customers.

For other customers, the Account Manager may decide the activities and approach suitable for each customer.

Roles & Responsibilities

- Serve as the interface between the Customer and Acsone
- Visit regularly the Customer, looking
 - After current ongoing Project(s), within steering committees for instance
 - For new business opportunities
 - For (billable) Change Requests
 - In view of initiating and/or influencing future requirements and Cft
- Initiate his/her Customers satisfaction survey and enquire upon non-promoting attitudes if detected
- Have a complete and detailed view of ALL Acsones interactions with the Customer and be ready to react either way as soon as deviations occur
- Together with Marketing and Communication, define and put in place adhoc tactics that support the development of the activities and the relationship
- Support sales activities in terms of extensions to existing contracts which:
 - Result from a diligent approach by the Account Manager and/or the *Project Manager(s)*
 - Are due to a stream of novelty the Customer would desire on top, or instead, of existing contracted features (change requests)
 - Are validated by the various projects Steering Committee and the Customer
- The generic sales activities are the following:
 - Submit business opportunity, with a risk assessment, to the *Sales Decision Committee* , which will validate (or prohibit) entering the bidding cycle
 - Carry out the bidding effort and subsequent negotiation
 - Close the deal

Whos who

The Account Manager of a given customer is indicated in the Salesperson field of the Customer form in *Odoo*.

Note: In rare situations where the Odoo Customer (as a juridical entity) is too big to have a single account manager, the Salesperson field is to be left empty and the Account Manager field on the Contract will prevail.

When the Account Manager is also responsible for the sales of a new project, he/she is indicated in the Salesperson field of the Opportunity form in *Odoo*.

Deliverables

- Quarterly Customer Activity Report, with:
 - Incidents [any type] and remediation
 - Business trends
 - Technological trends
 - Risk analysis
 - Key Customer officials [identifying the inner salespersons]
 - Customer Satisfaction Survey analysis

- Approved Steering Committee meetings reports as prepared by the *Project Manager*(s) or the Customer
- Up-to-date status information of the sales opportunity in *Odoo* (mandatory even for small accounts)
- All documents required to close the deal (eg signed contract, mandatory even for small accounts)

3.1.4 Bid Manager

Scope

There is one Bid Manager designated for each bid that requires significant resources in addition to the *Business Development Officer* and/or *Account Manager*.

Roles & Responsibilities

The Bid Managers (BM) are essentially *Project Managers (PM)* empowered to conduct a bidding project up till its conclusion, i.e. a valid Tender {or as it sometimes happens an Expression of Interest}. The BM acts as Single Point of Contact for Acsones resources, and, in case of consortium/subcontractor bid, for each consortium member. The BM works in close collaboration with the *Business Development Officer*, *Account Manager* and *Solution Owner*. The BM is responsible to guarantee a good comprehension of the topics of the tender, to offer a good answer in regards of the requirements.

- (As any other PM) Claim enough resources (technical, commercial, functional) to be allocated to the bidding project
- Interchange with Consortium partner(s), signing MoU and NDA
- Coordinate Acsones resources along a bidding project plan agreed with the Consortium partner(s)
- Collect mandatory (legal and commercial) documentation
- (if pertinent) Take contact with the contracting authority to obtain clarifications
- Collect updated CVs
- Collect updated References
- Assess continuously risks of tendering and report to SDC (a bid may be interrupted in the middle of the effort if circumstances so demand)
- Assess offered prices
- Assess offered solution
- Submit Acsones contribution to the bid to peer review and/or QA check
- Finalise Acsones contribution to the bid in time and send it to Consortium partner(s) (if pertinent)
- (if pertinent) Assemble Consortium partner(s) contribution to the bid
- (if pertinent) Release Tender to the CfT emitter.
- Take part to the Bid Process
- Organize the post-mortem

When the deal is won

- Organize in close collaboration with the *Business Development Officer* and/or *Account Manager*.
 - the signature of the Contract and other contractual aspects
 - the MoU with Consortium partner(s) for the realisation
- Organize in close collaboration with the PM the launching of the project
 - BoM if applicable (e.g. new hw, devt productivity tool, secured premises, etc.)
 - Blueprint of the solution as per bid

- Tentative list of deliverables
- Tentative project team staffing, including external resources
- Tentative resource consumption plan
- Tentative project delivery time with phasing
- Risk analysis
- Organize in close collaboration with the Administrative Manager
 - Customers POs,
 - Customers contracts,
 - Invoicing scheme

When the deal is lost

- Lessons learned:
 - Internal
 - With consortium partner(s), whose partnership may need to be re-qualified
 - Input from Prospect (e.g. the EC), if any

Whos who

Bid managers are designated on an ad-hoc basis, one for each bid. This information is not recorded in any specific place.

Deliverables

- MoU with Consortium partner(s),
- NDA if applicable,
- The Tender, to be archived on the *File Server*.

3.1.5 Business Development Officer

Scope

The Business Development Officer is a key element of the sales force in charge of bringing in new business for the company. His sales activities are focused on developing the business with new customers or, when appropriate, with new organizations within existing (usually large) customers. He shall be able to detect opportunities through the whole offering of the company (ie all business lines) and execute the *Bid Procedure* till the closing of the deal.

Roles & Responsibilities

- Understand the Business Lines solution(s)
- Explore the market segment(s) defined by the *Solution Owners*
- Collaborate with Marketing and Communication to define the appropriate MarCom strategy and initiate and run related tactics
- Seek and entertain relationship with candidate (consortium) partners
- Receive, filter and assess all pertinent electronic CfTs
- Collaborate with the *Bid Manager* in order to draft offers and evaluate prices taking account of:

- Prospects requirements analysis
- Technical assessment, with the support of Technicians
- Skilled resources availability and daily rate
- Likely time-to-market (the sooner the better)
- Behind-the-scene negotiation
- (possibly) Have demonstration prepared and/or mock-up constructed by Technicians
- Negotiate the final bid {under the control of the *Sales Decision Committee* in case of rebates }
- Keep track of all contacts with Prospects/Customers under the form of brief visit/contact reports
- The generic sales activities are the following:
 - Submit business opportunity, with a risk assessment, to the *Sales Decision Committee* , which will validate (or prohibit) entering the bidding cycle
 - Contribute to the bidding effort and carry out subsequent negotiation
 - Close the deal

Whos who

The Business Development Officer of a given project/opportunity is indicated in the Salesperson field of the Opportunity form in *Odoo*.

Deliverables

- Monthly Sales Activity Report, with:
 - List of Prospects visited, with key Prospect officials [identifying the inner salespersons]
 - Known facts about competitors
 - Incident analysis, if pertinent (e.g. pricing too high for easy sales, or demo ill-conducted, etc.)
 - Business trends and risks associated
 - Prevision of sales
- Up-to-date status information of the sales opportunity in *Odoo*
- All the required documents required to close the deal (eg signed contract)

3.2 Bid Procedure

3.2.1 Goal

This procedure describes the mandatory actions to be taken when an opportunity is identified.

The objectives are:

- Have a management agreement on the opportunities that worth a bid process in respect will all companies parameters (in business scope or not?, aligned with Acsones Key strategic priorities, risks, staff workload for the bid and/or the project implementation,);
- Have a constant view on the stage of each opportunity;
- Identify the risks for the company;
- Ensure the identification and the availability of the bid team;
- Ensure that the offers meet Acsones quality standards.

3.2.2 Trigger

This procedure is launched as soon as a sales opportunity is identified.

A sales opportunity is defined as:

- An identified concrete prospect/customer and project/mission;

In the scope of a frame contract, the *Sales Decision Committee* may empower the *Account Manager* and allows him to bypass the bid process for the offers written in the scope of this contract. In this case the opportunities are written under the responsibility of the *Account Manager* and directly validated/signed by the signatories (see hereunder).

Important to distinguish the leads (hints for future opportunities) from the real opportunities (when approved, an opportunity leads to a bid).

3.2.3 Steps

Step 1: Identification of an opportunity

When an opportunity is identified, the *Account Manager* creates a record within *Odoo* (Sales - Opportunities).

The opportunity within *Odoo* defines:

- The customer or prospect;
- The account manager responsible for this opportunity;
- A short description of the opportunity;
- The expected amount;
- The expected date of closing;
- The next action;

Each new opportunity is created in stage New, which means that the opportunity is identified but has not been qualified/approved by the *Sales Decision Committee*.

Step 2: Qualification - Go / No go

The opportunities are analyzed by the *Sales Decision Committee* either offline (validation per email) or during a meeting. *Account Managers* are involved and provide to the *Sales Decision Committee* the necessary information (particularly the risks related to this opportunity, our winning chances, our relation with the customer, etc.) in order to decide a Go or No go.

Opportunities involving technologies that are unusual for Acsonne are discussed with the *CTO*.

When an opportunity needs to be discussed during a *Sales Decision Committee*, the *Account Manager* paints it in orange within *Odoo* and makes sure that a short description of the opportunity is written in the opportunity Note field.

When necessary the *Sales Decision Committee* asks that the opportunity is more deeply investigated before deciding. In this case the opportunity is put in the Qualification stage and a *Bid Manager* is assigned. The *Bid Manager* reports directly to the *Account Manager* and *Sales Decision Committee* and provides the details in order to take the Go / No go decision.

Opportunities involving a significant risk on resources (because they are unusually big or involve particularly strict planning constraints) are discussed with the *HR Allocation Owner*.

Opportunities involving a significant financial risk (budget above 500K€, special penalties clauses) should be submitted to the CFO and CEO before confirming a Go.

- No go decision: the opportunity is put in the Dead stage and a short motivation for the No go must be added.

- Go decision: the opportunity is put in the stage Proposition and the bid team is appointed (see description below) under the responsibility of the *Bid Manager* appointed by the Sales Decision Committee` (see below). A task is created/opened in :acsapp: Odoo on the sales/presales project and associated to this opportunity.
- To be further investigated: the opportunity is put in stage Qualification as the *Sales Decision Committee* needs some more information to decide about the Go / No go. In this case a *Bid Manager* is assigned who is responsible for clarifying the opportunity for the *Sales Decision Committee*

A task related to the opportunity is created in the *Odoo* Sales and Presales project and is used by each bid team member to collect the time spent on the bid.

Step 3: Organization of the bid

The following actions are necessary and achieved under the coordination of the *Bid Manager* :

- Put the documents (call for tender, other necessary documents) on the share drive under Bid Management folder;
- Inform the Administration executive about the bid process so that administrative aspects (mandatory documents, practical organization of the offer delivery, etc.) are fulfilled before the proposal deadline;
- Contact necessary supporting persons like Technological Leader, *Analyst* or *Account Manager*, QA assistant when needed
- Organize and plan the writing of the proposal

Step 4: Validation of the bid

The deadline for submitting the persons that will sign the offer, referred hereunder as the signatories, is agreed between the parties. If possible the *Bid Manager* delivers regularly partial results in order to facilitate the review (QA aspect) and validation process.

The *Bid Manager* plans the validation of the offer within the bid team before submitting it to the signatories.

In order to get the final validation of the bid, the signatories require:

- For fix price proposals, a task breakdown with related efforts (mandays) and prices (Euros)
- A document compliant to the proposal template (short or extended version), or compliant to the templates imposed by the customer

Remarks from the bid team and signatories are integrated in the final version of the offer, which is submitted to the signature.

Step 5: Send the proposal to the customer, save & archive the final version of the documents

When the proposal is validated, it may be signed and sent to the customer.

Then:

- *Account Manager* puts the proposal in *Odoo* in stage Sent.
- Administrative Executive archives the final version of the document and the signed version within the Client or Prospect directory on the *File Server*.

Step 6: Follow-up

The *Account Manager* follows the selection process at customer/prospect side and puts the necessary efforts and resources in order to convince the customer of our solution and approach.

The *Account Manager* informs regularly the *Sales Decision Committee* of the evolution of the dossier. Either he updates the opportunity in *Odoo* or he uses other communication channels to keep the committee up to date.

When the customer asks for a negotiation (BAFO, presentation, other), the opportunity stage is set to Negotiation in *Odoo*. Each new version of the proposal must be validated by the *Bid Manager*, *Account Manager* and signatories.

Step 7: Success or Failure

The *Account Manager* communicates the customers decision to the Management Committee and the Administration Executive.

If the customer chooses Acsones, the *Account Manager* puts the opportunity in stage Won and the reasons why Acsones won are shortly described in the opportunity within *Odoo*.

The *HR Allocation Owner* is informed and plans the execution of the mission.

Otherwise he/she puts the offer in stage Lost and the reasons why Acsones lost are described in the opportunity.

3.2.4 The bid team

The *Bid Manager* is appointed by the *Sales Decision Committee*.

The composition of the bid team depends on the bid complexity and size.

The bid team involves at least:

- The *Account Manager* for related customer/prospect/contract;
- A *Bid Manager* who will be responsible for the bid organization.

Other bid members are appointed when needed by the *Bid Manager* in perfect synchronization with the *HR Allocation Owner*, including but not limited to:

- Writers that contribute to the bid writing;
- Functional experts that provide functional expertise to the bid writers;
- Technical experts that provide technical expertise, prepare demos, write technical parts of the offer;
- Reviewers that review part of the offer and ensure the quality of the deliverables.

3.2.5 Control mechanisms

- When asking to sign a proposal, Administration Executive always refers to the location of the proposal on the Bid Management directory.
- The bid team registers its time on an *Odoo* task that is directly related to the opportunity. No opportunity => No task => No work.
- Before sending the offer, Administration Executive checks that:
 - Latest version of the documents related to the bid (call for tender, communication with the customer, proposal and annexes) is put in the Prospect/Client directory.
 - Signed version of the offer (at least the signature page) has been scanned and put in the Prospect/Client directory.
 - All exchanged documents with the customer after the proposal submission (QA sessions, presentation, notification,) are stored in the Prospect/Client directory.

3.3 Customer Appraisal

3.3.1 Goal

This procedure describes how Acsonone will evaluate the customer satisfaction and take the necessary measures in order to enhance identified weak points.

The objectives are:

- Have a regular measure of each customer satisfaction (below 7/10 = detractors; between 7/10 and 8/10 = passive; above 8/10 = promoters);
- Have a measure of the mean satisfaction, aka net promoter score (defined as %tage of promoters - %tage of detractors);
- Identify the enhancement possibilities;
- Ensure a continuous evolution of best practices.

In order to get this overview, Acsonone uses the Net Promoter Score (<https://www.netpromoter.com/know/>).

3.3.2 Trigger

This procedure is launched :

- When projects (or project phases for big projects) are delivered or missions are finished;
- On a regular basis (at least once a year) for consultancy missions.

3.3.3 Steps

Step 1: Follow-up of the projects and missions

Odoo keeps track of all active projects. The *Project Manager* is responsible to follow-up the project/mission and identify the triggers for the launch of a satisfaction survey.

The *Account Manager* (with the help of the *QA Assistant*) ensures that the customer satisfaction is checked at least once a year).

Together they identify the key persons at customer side who will receive the satisfaction survey form.

Step 2: Sending of the satisfaction survey

The satisfaction form is a simple multilingual online Form available here <https://www.acsone.eu/satisfaction/en/>.

The form is sent by email with a prepared text (available in the Google spreadsheet that lists the surveys campaigns - see Records section).

Each quarter the *QA Assistant* polls the *Account Manager* about potential projects or missions for which a satisfaction survey is needed. He also informs the *Account Manager* when a customer hasnt been questioned since one year.

The *QA Assistant* synchronizes with the *Account Manager* and sends the satisfaction form to the customer key persons.

Step 3: Reminders and results recording

The *QA Assistant* checks the answers to the sent surveys and sends a maximum of 2 reminders (one per email and the other per phone call) to the customer key persons.

When an answer is received, it is automatically registered within a the form related Google Spreadsheet.

Step 4: Publication of the results

Each time a survey is received, the *QA Assistant* sends an email with the answer to the management (management@acsone.eu).

Acsones global satisfaction score is updated.

Step 5: Analysis and follow-up

In all cases the *Account Manager* analyses the survey and particularly the answer to the Why? question (why the customer would recommend or not recommend Acsones to friend or business partners).

When the score is lower or equal to 8/10, the *Account Manager* is in charge to contact the person that filled the survey and gather more details and points of actions.

Internal corrective actions are discussed between the *Account Manager*, *Project Manager* and other stakeholders if necessary (management, consultants, etc.).

These actions are recorded within Odoos feedback module and followed up by the *Account Manager*.

At least once per once per quarter the *Account Manager* checks the corrective actions for his customer and ensure that these are followed by the project/mission team.

3.3.4 Records

- The Google form related spreadsheet that keeps track of all surveys results is [available here](#). The Google form related spreadsheet contains a bar graph that shows the evolution of the Net Promoters Score for the last 12 months by subtracting the percentage of promoters and detractors (see above). This number ranges between -100 (only detractors) to 100 (only promoters).
- The Google form related spreadsheet that keeps track of all surveys campaigns is [available here](#). It also shows the email text to use when sending a survey to the customer.

3.3.5 Control mechanisms

The control of the good execution of this procedure is done during the annual management review meeting.

The *QA Assistant* presents the list of customers/project that have not been subject to survey and the management analyzes the reasons why and take the necessary measures to correct the situation when needed.

3.4 Claim Management

3.4.1 Goal

This procedure describes the actions to be taken in case of a claim is received from the customer or any third party.

Claim management process is used for customer problems or complaints that indicate a serious and/or lasting customer dissatisfaction. On the opposite of claim, occasional remarks, incidents or minor dysfunctions should not immediately trigger this process. They are handled by the Project Manager and/or the Account Manager in order to keep the customer satisfied.

This procedure describes the mandatory actions to be taken when a claim is identified.

The objectives are:

- keeping/restoring customers trust and
- learning from this type of feedback and possibly prevent such eventual problem from occurring again.

3.4.2 Trigger

This procedure is launched as soon as any claim about Acsones or Acsones team/employee work is communicated by the customer in a formal way.

A claim may be received by several means: Letter, fax, email, during a meeting, a phone call, a survey.

3.4.3 Steps

Step 1: Reception and dispatching of the Complaint

In all cases, the person who has received the complaint or question must inform the responsible and more particularly:

- the *Account Manager* of the customer; he will be mandate for defining the feedback;
- the *QA Assistant*;

In all cases, the CEO must be informed. If the action of the *Account Manager* could be penalized by the claim, the CEO will mandate another person.

If he/she judges that the problem needs immediate attention, the step 3 is started immediately.

Step 2: Registration of the Complaint

A complaint support (letter, fax or email) is registered using *Odoo* Feedback application.

The Odoo Feedback module ensures the analysis and surveillance/follow-up of the complaint.

Step 3: Organization of the answer, resolution and feedback and the appropriate solution

- *Account Manager* gathers the necessary information and inform the customer that Acsones is working on the problem.
- *Account Manager* organizes the work in order to analyse the claim and elaborate an appropriate answer. In order to do so in can/should involve all the necessary persons.
- *Account Manager* prepares or validates the answer that will be sent to the customer.

Step 4: Record the Corrective and Preventive Action

If the claim enables identifying a general/organizational issue at Acsones, then the QA Assistant is informed and inserts an entry in the CAPA (Corrective and Preventive Actions) register.

Step 5: Give feedback to the customer

The Customer must be informed as soon as possible about the decision and actions undertaken following his claim.

Several channels to communicate may be used: at least as formal as the channel used by the customer (email, fax, or registered letter, ..). If it was done by phone, Acsoné will use the email to communicate.

The content of the feedback of a complaint must include the following:

- If the solution is not immediate (more than one week for discussion, consideration about solution to provide, etc), an acknowledgement must be sent to the Customer. The acknowledgement must include a proposed delay for the follow-up. Of course, this delay must be respected.
- If the solution can be provided very quickly, the Customer is informed directly of the solution and action undertaken.
- If required a meeting with the Customer is organized.

Anyway the Customer must be invited to give immediate feedback about the proposed solution.

Step 6: Close the Complaint

As soon the Customer has expressed a positive opinion to the feedback of his complaint, the date of the customers feedback is registered in acsapp::Odoo and the claim is closed.

3.4.4 Control mechanisms

- Each claim is registered in the Feedback module of *Odoo*

DELIVERY

A delivery by Acsone results from a successful bid (see above). It can be:

- A project
- A punctual assignment (the mission: body-shopping or consultancy)
- The delivery of an off-the-shelve solution (to be parameterised at delivery time).

The general flow of activities entails the following:

- Every delivery is supervised by the *Account Manager* in charge of the Customer
- An assigned *Project Manager* is managing any project [Acsone methodology applies!]
- Any project or mission is staffed by the *HR Allocation Owner* in collaboration with the *CTO*
- Any delivery is controlled by the *Project QA*, in collaboration with the testing team
- Any project is underpinned by the technical environment and tools supplied by the *CTO* and by the assistance provided by the *PMO* (best practices, project plans, delivery matrix and any other project documentation, translation, etc.)
- Any project, when finished, is transitioned to the support-and-maintenance team
- Any delivery is monitored by the Delivery Controller (projects analytics, time sheets, invoices and payments)

4.1 Roles

4.1.1 HR Allocation Owner

Scope

This part of the overall HR Function is devoted to allocating resources. The resources may be:

- Project Managers
- Consultants
- Analysts
- Developers

Other resources may intervene in the course of the projects, at the PMs request: testers, trainers, or the CTO.

Roles & Responsibilities

In order to allocate resources to signed assignments, the HR Allocation function must:

- Know what skills are requested in order to carry the assignment out successfully
- Know where resources are currently occupied and their foreseeable availability
- Know what external resources might be summoned to the assignment in a reasonable timeframe

Whos who

Currently the HR Allocation Owner is sbi.

Deliverables

- Monthly review of the missing resources and the resources that wont be fully assigned in the coming weeks/months.

4.1.2 Project Manager

Scope

A Project Manager is assigned to each project.

The Project Manager is responsible for delivering the project deliverables within time and budget, satisfying the quality requirements.

Roles & Responsibilities

- Understand the mission assignment (Customers activity domain, business problem or technical requirements) as per the bid accepted by the Customer
- Develop a very good understanding of customer priorities, in order to ensure the features that bring the most added value are delivered first.
- Develop a very good and continuous understanding of the progress of project activities, in order to anticipate delays and adjust and communicate priorities accordingly.
- Take over the documents prepared at won deal time
- Set up the Project file and keep it updated at all times
- Design the project phasing and communicate to Customer, project team and Account manager
- Determine necessary resource and their ramp-up into the project team
- Ensure that the BoM (Bill of Material) is executed in time and the project environment (development, testing) is set up
- Plan activities (using either GANTT chart either Excel) in line with timeframe and/or allotted budget:
 - Analysis
 - Development
 - Testing
 - Documentation
 - Training
 - Packaging

- Organise meetings with Customers representatives
- Organise (scrum) meetings with project team
- Report progress vs. planned
- Prepare Steering Committee with Customers representatives and the *Account Manager*
- Report any incident or risk to Acsones *Account Manager*
- Gather completed timesheets and expense reports regularly
- Signal when intermediate deliverables (or time periods) are approved by Customer in order to trigger invoicing
- Coordinate with Acsones *Project QA* for organising the testing campaign(s) and deliverable review
- Coordinate with Acsones Trainer for preparing any training materials and sessions
- Coordinate with Acsones Support and Maintenance Manager for switching over to maintenance mode
- Contribute to PM best practices improvement by collaborating on the handbook and document templates.

Whos who

The project manager is defined in the *Project Manager* field of each project page within *Odoo*.

Deliverables

- Any report pertaining to the assignment, including but not limited to:
 - Project file: high level planning of the deliverables (planning and remaining effort), human resource planning, behavior of the project (baseline versus actuals)
 - Steering Committee agendas minutes
 - List of issues
 - Risk register
 - Change requests
 - Manage the milestones (iterations) in *plan.io*
- Timesheets
- Expense reports

The frequency and the format of the reports is agreed between the project manager, the *Account Manager* and the customer. As these reports are discussed during the steering committee the project manager should ensure that a recent version of the reports is available to the steering committee members.

As the planning and remaining efforts reports are also used by the *Account Manager* in order to estimate the PoC (percentage of completion) of the project and the forecasted margin, this report should be updated at least on a monthly basis.

4.1.3 Consultant

Scope

A Consultant is a person detached by Acsones to a Customer in order to fulfill a mission. He/she may be an employee or not, working in various fields, such as technical, functional, testing.

Roles & Responsibilities

- Understand the mission assignment (Customers activity domain, business problem or technical requirements) as per the bid accepted by the Customer
- Fulfill the detailed contractual request
- Plan activities in line with timeframe and/or allotted budget
- Report any incident or risk to Acsones *Account Manager*
- Fill time-sheets and expense reports regularly
- For mission critical reports, draft reports and submit them to Acsones *Account Manager* or delegate before delivering them to the Customer
- Signal when the final report is approved by the Customer, and the mission is ended
- Be attentive to additional business opportunities for Acsones and report them to the *Account Manager*.

Whos who

The Consultant is a Team member defined on the Project sheet within *Odoo*

Deliverables

- Timesheets
- Expense reports
- Any report pertaining to the assignment

4.1.4 Analyst

Scope

The Business Analyst analyses the business of Clients and write business and functional requirements.

Roles & Responsibilities

- Understand the mission assignment (Customers activity domain and business problem) as per the bid accepted by the Customer
- Analyse
 - the business problem
 - the Customers requirements
 - the underlying non-expressed needs (e.g. GUI charter)
- Produce an analysis under a form that is:
 - approved by the *Project Manager* (who involves the *Project QA* when needed)

- readable by the whole project team (Customer and Acsones)
- usable by the *Developers*
- translatable into test scenarios by the *Testers*

A key responsibility of the Analyst is to express requirements under a textual and/or visual form that is easy to understand by all stakeholders. In some projects, it will take the form of documents and diagrams. When development starts, the Analyst creates *plan.io* issues in order to prioritize and track development. Such issues must be sufficiently fine grained to be implementable as self contained units in a short amount of time. Creating the *plan.io* issues is done in close collaboration with the *Developers*.

Whos who

On each project, the Analysts are clearly identified and communicated to the customer and the project team. The information is shared either within the Project Plan or through oral communication during the projet/mission kick-off.

Deliverables

- Analysis documents
 - Business rules
 - Data model
 - Interfacing constraints
 - GUI

4.1.5 Developer

Scope

The developers are part of a project team and contribute to the technical design and implementation of a project. They might also be involved in Acsones R&D activities.

Their focus is more the technical aspects of the solutions that we deliver, but they must always acquire a good understanding of the customer business, processes and constraints. In particular developers are expected to challenge the functional design and understand the business purpose of what they are developing, in order to ensure the proposed solution is the most efficient and simplest to implement.

Roles & Responsibilities

Basing themselves upon the analysis documents prepared by the *Analyst*, or upon the results from Agile validation checkpoints, and upon the state-of-the-art of technology:

- Understand the business requirements;
- Design a technical solution;
- Implement the solution;
- Implement automatic tests for the solution;
- Manually test what they have developed, before passing to the *Tester*;
- Peer review the work of other developers;
- Contribute to Acsones development best practices by proposing enhancements/evolutions to the *CTO* and the *Solution Owner*;

- Work in close collaboration with the *Project Manager*, *Analyst* and *Tester* to maintain *plan.io* issues in a clean state (fine grained issues, correctly allocated to categories, tracker and milestone, with the adequate state etc).
- Ensure the code commits correctly the related plan.io issues, in order to ensure traceability and ease future understanding of the codebase.

Whos who

For each project, the list of developers is specified within *gitlab* as the project members and in *Odoo*.

Deliverables

- Versioned source code of the solutions including
 - The documented code of the delivered applications
 - The documented code for unit testing
 - The documented code/configuration for build/deployment
- Merge requests within *gitlab*
- Reviews of others merge requests within *gitlab*
- Technical documentation (installation/deployment guides, solution architecture, technical analysis)

4.1.6 Project QA

Scope

Within each project or mission, the Project QA is in charge of guaranteeing the overall quality of the items and services delivered to Customers.

The project QA works under the responsibility of the *Project Manager*.

Roles & Responsibilities

- (with the *Project Manager* and/or project *Analyst*) Review the test plan and scenarios
- (with the *Project Manager* and/or project *Analyst*) Review the analysis documents
- (with the *Project Manager* and/or project *Analyst*) Review the planio tickets description (mainly the features tickets, bugs if appropriate)
- Check the test results and issue the quality certificates (for instance completed test plan) to corresponding deliverables and versioned software
- (with the *Project Manager*) Conceive specific performance testing in order to meet the performance demands as per the SLA (if any)
- Check (or ensure check of) any published report or textual deliverable
- Contribute to PM best practices improvement by collaborating on the handbook and document templates.

The Project QA is also responsible to ensure that the project follows the best practices documented in our quality system and deliver the required results.

Whos who

The project QA is specified either in the project plan or during the project/mission kick-off..

Deliverables

- Approved deliverables

4.1.7 Tester

Scope

When the project size of complexity requires it, a tester is appointed and ensure that deliverables are compliant regarding the business requirements and quality standards.

On smaller projects this role can be assumed either by the *Project Manager* or the *Analyst*.

Roles & Responsibilities

The tester is able to:

- Conceive testing scenarios;
- Build test data sets;
- Conduct testing, and analyse results
- Document exceptions

Whos who

The testers are specified either in the project plan or during the project/mission kick-off.

Deliverables

- Test scenarios and test data sets
- Testing reports (Test plan) with exceptions
- Documentation of issues within the bug tracking system *plan.io*

4.1.8 Training Manager

Todo: This role should be moved to support function

4.1.9 Trainer

Scope

Trainer are appointed on a project when a training class or training material (self-training, videos,) has been included within the project deliverables.

Trainer are *Project Manager, Analyst, Developer, Consultant* that are assigned to training tasks depending on the nature of the trainings.

Roles & Responsibilities

- Conceive the training plan
- Organise and plan the training classes with Customers
- Understand the system for which a training has been ordered
- Conceive the training material
- Prepare system with anonymised data, so as to capture meaningful screens
- Use animation tools that create self-tutorials (e.g. playable on-line)
- (if needed) Lecture a class

Whos who

The trainers are specified either in the project plan or during the project/mission kick-off.

Deliverables

- Training plan
- Training class calendar
- Training material
- Animated self-training sets
- Training class evaluation forms report

4.1.10 Level 1 Helpdesk Dispatcher

Scope

When a project enters in Maintenance mode, the Level 1 Helpdesk Dispatcher is appointed and becomes the single point of contact for the customer.

Depending on the size of the project this can be a dedicated team, a shared team or even a single person.

Roles & Responsibilities

These are a centralised (possibly remote) team able to pick up any call from Customers under maintenance:

- Question and request for information
- Incident notification and request for assistance

They are therefore knowledgeable about the Customers situation, by means of:

- The maintenance plan
- The information regularly updated to the ticketing system

They must be available:

- Over the phone at the contracted time
- In a language spoken by the Customers

Whos who

The Level 1 Helpdesk team is specified within the project wiki page on [plan.io](#).

The persons from the Level 1 Helpdesk team are not always detailed to the customer (Level 1 helpdesk is proposed as a service, not as special consultants).

Deliverables

- Updates to the project helpdesk ticketing system.

4.1.11 Level 2 Maintenance Officer

Scope

When a project is delivered and goes into Maintenance, a support team is assigned.

Level 2 Maintenance Officers are in charge of analyzing and solving issues reported by the customer and that cannot be answered by the *Level 1 Helpdesk Dispatcher*.

These are basically:

- The *Analyst(s)* who were in charge of the original project analysis, for questions and incident solving
- The *Developer(s)* who were in charge of the original project development, for incident solving and bug fixing

Roles & Responsibilities

- Be reachable by the ticketing system workflow
- Acknowledge the Customer that their question/incident is promptly treated by Acsonne [reassurance and respect of the SLA conditions]
- Examine questions and find answers
- Enquire upon the incident
 - Set up the playground system in conditions similar to the Customers
 - Endeavour to reproduce incident
 - Solve the issue if any
 - Prepare an update (patch, new parameters, improved documentation, etc.)

- Call/mail back the Customer
- Update the ticketing system with pertinent information for further reference and close the ticket

Whos who

The Level 2 Maintenance Officer(s) are specified in the wiki of the project on *Odoo* and have access to the appropriate *plan.io* project or the Customers ticketing system.

Deliverables

- Solution sent to Customer

TECHNOLOGY AND METHODS

5.1 Roles

5.1.1 Project Management Officer

Scope

The Project Management Officer (PMO) organizes, defines and maintains standards for project management and analysis within Acsona.

The PMO works in close cooperation with the *CTO* in order to ensure consistency between project management and analysis practices on the one hand, and software development practices on the other hand.

Roles & Responsibilities

The PMO:

- Gathers and publishes best practices in terms of project management and analysis;
- Devise and maintain standard documents and forms such as time-sheets, project documents, planning and reporting;

Whos who

The Acsona PMO is ccs.

Deliverables

- Best practices in terms of project management and analysis;
- Report on project management and analysis practices evolutions;
- Templates for standard documentary deliverables;
- Tools and software recommendations for PM and analysis (eg diagramming tools), in close cooperation with the *CTO*.

5.1.2 Chief Technical Officer

Scope

There is one CTO for Acsone.

The CTO oversees and steers technology Acsones technological orientations.

Roles & Responsibilities

- Gather, document and help implementing Software Development best practices.
- In close cooperation with the *PMO*, select and help implementing Software Development, Project Management and Analysis tools.
- Defines and help implementing the overall Acsone ICT infrastructure (network, telephony, etc).

Additionally, the CTO provides support to various processes:

- Participate in the *Bid Procedure* to help with technology choices and support presales activities.
-

Whos who

Acsones CTO is sbi.

Deliverables

-

5.2 Software development guidelines

5.2.1 plan.io usage guidelines

This document describes general usage rules for redmine (planio) at Acsone.

Issue types (trackers)

Bug A problem with the software not working according to the specifications. Bugs can be submitted by the Customer or during Acsone testing. To be fixed, bugs are associated with a milestone. Closed Bugs associated with a milestone are displayed in the release notes for the corresponding release (unless marked private).

Feature A new feature or change to existing features of the applications. Feature requests can be submitted directly by the Customer or (more commonly) are the result of an analysis and/or an offer. To be implemented, Features may be split in Tasks, and are associated with a milestone. Closed Features associated with with a milestone are displayed in the release notes for the corresponding release.

Tasks Tasks are either support requests or non-development activities, or detailed activities required to implement Features or fix Bugs that we typically dont want to show in release notes. When Features or Bugs are large enough (more than a few days of work), they are split in Tasks, so Tasks can be associated to milestones. Tasks are normally not requested directly by the customer (except for support request).

Custom fields on Issues

Field name	Tracker	Type	Usage
Affected version	Bug	Milestone	Report on which version (=milestone) a bug has been detected
Customer reference	Bug, Feature, Task	Text	Link an issue in our plan.io to an issue in the customers issue tracking system. This is normally an identifier. The way to find the issue in the customers system is project-specific (such as, for instance, prepending the URL prefix of the customers JIRA system).
Work package	Bug, Feature, Task	Text	The Work Package financing the work on the issue (aka Purchase Order, Specific Contract, etc).
Date-Time Acknowledged	Bug, Feature, Task	Text YYYY-MM-DD[T]HH:MM:SS	Acknowledgement date and time (for SLA).
Date-Time Answered	Bug, Feature, Task	Text YYYY-MM-DD[T]HH:MM:SS	Response date and time (for SLA).
Date-Time Workaround	Bug	Text YYYY-MM-DD[T]HH:MM:SS	Workaround date and time (for SLA).
Root Cause Analysis	Bug	Text	Identify and analyze main causes that led to bugs and used to initiate actions to prevent similar problems to occur in the future. So far it is free text but could be converted to a list of the most frequent causes

Issue Statuses

New Just created, the default status. Ideas, customer requests awaiting triage. The next status is typically Confirmed or Rejected. Confirming the issue can be the responsibility of the Customer in case it has appointed someone to do triaging. Confirming the issue can almost be the responsibility of an Acsones team member.

Confirmed Issue confirmed. Work can start when an issue has been assigned to a milestone. Assigning issues to milestones is typically done in sprint planning meeting. Depending on the project organization the issue will be assigned to a team member or team members will pick-up issues in the current milestones, according to the priorities and/or ordering in the task board.

In Progress The assignee is working on it.

In Review The work is almost done and awaiting or undergoing review before merging on `master`.

Resolved The work is done and merged on the `master` branch, awaiting testing (FAT or internal Acsones validation). This state is set automatically by planio when a commit message has `fixes #...` or `closes #...` with issue number.

Feedback Awaiting feedback from the current assignee. Typically used to request clarification on a functional or technical matter.

Closed This status has a slightly different meaning depending on the type of issue. For development activities (Feature, Bug, Task), Closed means it is merged on `master` and has undergone validation (FAT). If it is a support Task, Closed means it is done. Comments must describe at least briefly how the support request

was handled. All Closed Features and Bugs that are assigned to a milestone are listed in the corresponding release note.

Rejected Aka not-a-bug or wont fix. The comments must explain why it was Rejected.

Issue Priorities

Low, Normal (the default), High, Urgent, Immediate.

Roles

Reporter Typically assigned to Customers

Reporter Manager The Reporter Manager has no specific permissions except it can change the status from New to Confirmed. To be used in combination with Reporter to have a specific person at the Customer in charge of triaging new issues.

Developer

Manager

Docs and File Manager This role can Manage Document and Files. Useful in complement to Reporter for customers who can report issues as well as upload documents

5.2.2 Issue tracking report instructions

Goal

This document describes the required information needed to create effective feature and bug reports. Applying these recommendations:

- Help the project team to increase the understanding of the customers business problem with features correctly and fully described;
- Contribute to clarify the scope of a development iteration;
- Save cost and time during a project cycle by reducing the issues round trip;
- Reduce tickets duplications;
- Make happier developers.

Trigger

Each project team member should apply these recommendations each time an issue report is written.

How to report a bug or a feature

- Use an issue tracking system; either Acsones issue tracker planio or the customer issue system: it already provides a prebuilt template gathering the base information needed to describe a bug or a feature;
- Search first if the same issue does not already exist
- Create atomic bugs: one ticket should describe only one bug. Do not list multiple defects in a single bug report; create one bug report per defect.
- Bug subject:
 - provide a specific subject, not a meaningless or too generic one: this must help to understand and find immediately the issue. This also helps to avoid bug report or feature request duplications (same bug reported in several tickets; it could be annoying for the team);

- A good summary should explain the problem, not your suggested solution
- Example: the subject Site not working does not provide enough information; a better title might be: Login into admin as SuperUser01 throwing 404 error - Chrome only
- Use only present tense in the comments.
- Use the name of the fields, buttons and other elements as displayed in the application
- Specify the correct tracker. See planio document for more explanation about acsones issue tracker planio:
 - Bug: for bugs discovered in Production or UAT
 - Feature: for new features or changes that are not bugs
 - Task: for support requests that do not lead to code changes and a new release
- Bug Description:
 - Before you go into the detail of steps to replicate the issue, you need a brief description of the issue to provide valuable context and so help the developer quickly understand the problem. Always assume that whomever is reading your report has never seen this part of the feature or work before, so will need to be easily guided by your description.
 - Be systematic, concise and precise in the way you describe the issues. Do not write irrelevant content;
 - Also think about who else might read your bug report. Its not just developers, but project managers and your fellow testers - who, again, might not have seen the work before.
 - Example of a bad description: Seeing an error on the screen. Example of a better description: When accessing the xxx screen as TestSuperuser on the tes environment, selecting the create new documents icon is throwing an error message - Cannot read content.
 - Steps to reproduce are the most important part of any bug report. If a developer is able to reproduce the bug, the bug is very likely to be fixed. If the steps are unclear, it might not even be possible to know whether the bug has been fixed. It should let anyone clearly see what you did to see the problem, and also allow them to recreate it easily themselves. This section should also include results - both expected and the actual - along with relevant URLs.
 - Use the following template (in addition of the existing fields of the issue tracker). Those are the most common found in the best practices:
 - * (TODO Create a template for the planio Description field)
 - * URL of the environment (in case of several tests environments)
 - * Platform/browser
 - * User role necessary to reproduce
 - * Steps to reproduce
 - * Expected results
 - Fully describe the expected functionality
 - Be sure that you well understand the fonctionality that the application has to provide
 - Add a link to the related section of the analysis document
 - * Actual results
 - For front-end issues: it helps a lot the developer if screenshots are added
 - If available: Include log files. This depends on the type of product. If you know where the log files are, send them.
- Feature Description:
 - Describe the current behaviour of the application. Always assume that whomever is reading your report has never seen this part of the feature or work before, so will need to be easily guided by your description.

- Describe how it should work in the future. Provide information about:
 - * Who is this feature for?
 - * What does this feature do? This gives some objective criteria by which you can all judge if the feature is done and helps the developers know when they can stop instead of over-engineering hoping they have done enough.
 - * Why does anyone want to do this thing? This gives a subjective criteria to measure if the user can succeed in their goal. Knowing that helps developers identify where the feature belongs, if there might be another way to accomplish the same thing with existing features, and make appropriate decisions when then inevitably find something you had not considered when requesting the feature. This also help avoid scenarios where the software now does what you asked but still doesnt let do you what you wanted.
- Useful things you might include: Suggestions or designs for how you want it presented, how this might impact other parts of the system you know about, the volume of data you expect this feature to handle, zhat to do when theres no data to display, failures you know you can expect

5.2.3 Working with Git

Commits

A good commit message must help your future self or colleague to understand why the code was created or modified. Why is the key word here. How should ideally be understandable by reading the clean code of the commit.

A Git commit message must include a reference to an issue identifier. Use refs # or fixes # with the plan.io issue number.

Todo: find good internet references about creating good commit messages

Tags

- x.y.z on the main repository
- x.y for the customer iterations, this corresponds exactly to the planio iteration number
- z for the bug fixes and the internal releases (iterations) inside the x.y iteration
- Each internal release requires a tagging (acsoo release). If this version led to a successful test campaign (OK from test suite and manual tests), this iteration can be released on the client environment.

We try to automate deployment of tagged versions, via GitLab jobs.

Branches

The `master` branch contains the latest version of the code, in preparation of the next release.

We prepare new features using short lived branches that are merged on `master` in a reasonably short time (1-2 days).

We use Merge Requests for code review and verifying automated tests pass before merging into `master`.

When we need to provide urgent bug fixes to the customer, we branch off the tag corresponding to the current deployment, fix the bug on that branch and merge it in `master` for inclusion of the bug fix in the next release.

5.3 Tips and tricks about python tooling

In some projects, we use many python tools. Installing them sanely on your machine will save you a lot of headaches. This document collects useful practices that work for us.

5.3.1 Never use pip with root

First of all, never use `pip` with `root` or `sudo` on a linux machine. `pip` and linux package manager dont have the exact same view on what is installed and how it is installed. So let the linux package manager manage what it manages and let `pip` manage virtual environments.

5.3.2 Install pip

`pip` is the python package installer. Its [documentation](#) explains how to install it. The following is recommended on linux:

Check if `pip` is installed:

```
$ python3 -m pip
```

If it is not installed, bootstrap it using `get-pip.py`.

```
$ curl -sSL https://bootstrap.pypa.io/get-pip.py -o get-pip.py
$ python3 get-pip.py --user
```

Then make sure `~/.local/bin` is in your `PATH`, as instructed.

5.3.3 Use pipx

We often use tools (scripts) that are distributed on [PyPI](#). The recommended way to easily install, upgrade and remove such scripts is to use `pipx` which will automatically create a virtual environment for each tool and install the scripts in your `PATH`.

The `pipx` documentation offers ways to install it. The following is recommended on linux.

And you can now install `pipx`.

```
$ python3 -m pip install --user --upgrade pipx
```

The `pipx` executable should then be available in `~/.local/bin`.

After that, all installation of python packages should always happen either:

- via `pipx`,
- or with `pip` in an `virtualenv`.

5.3.4 Do not use the virtualenv package from Ubuntu

In recent Ubuntu versions, the `virtualenv` package is broken, as it installs many useless dependencies in new virtual environments.

So install it with `pipx`:

```
$ pipx install virtualenv
```

5.3.5 Install different python versions on Ubuntu

Different Ubuntu versions come with different python versions. In our projects, it is sometimes necessary to use specific python versions. The [deadsnakes ppa](#) is a reliable way to install them.

5.4 Odoo specific guidelines

5.4.1 Useful python tools for Odoo projects

The following tools are required our Odoo projects. They can all be installed with `pipx`.

- `acsoo`
- `bumpversion`
- `git-aggregator`
- `git-autoshare` requires additional manual configuration after installation
- `pip-deepfreeze`
- `pre-commit`

5.4.2 Handling Odoo Security Advisories

Periodically, Odoo SA or OCA discover or is notified of security vulnerabilities. Such security vulnerabilities are patched and Odoo customers and OCA members are informed, so they can take appropriate actions.

For ACSONE, it is important to react promptly to such alerts in order to avoid security breaches in our customer instances, and increase the confidence of our customers that we manage their security in a proactive way.

Steps

Step 1: Evaluation of gravity and impacted versions

Who: pst

Identification of Odoo projects impacted by the vulnerabilities. The manager of this action must review each security notification to determine the severity and version of Odoo impacted. The result of this search is reported in a [tracking document](#)

This step also allows to update in the document:

- the list of applications maintained by Acsones
- assignment of project managers

Step 2: Information of project manager

Who: pst

Project Manager must be notified of published security notices in order to apply corrections to projects. The information is sent by email to the project managers and asks them to check in the tracking document (mentioned in step 1) if vulnerabilities are relevant to the applications for which they are responsible.

Step 3: Customer information

Who: *Project Manager*

Project managers inform clients by e-mail of the application of corrections. We can refer to the following example of mail

Bonjour Monsieur,
 Vous avez peut-être reçu une alerte d'Odoo concernant des failles de sécurité ↪
 ↪découvertes récemment.
 Elles ne représentent pas un risque sérieux dans votre cas.
 Toutefois, nous allons installer le <date> la toute dernière version de Odoo 9/10/
 ↪11 qui inclut ces correctifs.
 Il y aura une interruption de maximum 30 minutes.

 Nous effectuons cela dans le cadre du contrat forfaitaire d'hébergement.

 N'hésitez pas à nous contacter si vous constatez quelque chose d'inhabituel suite ↪
 ↪à cette mise à jour.

 Cordialement,

Step 4: Application of corrections

Who: *Project Manager*

Project managers must organize the installation of corrections.

- If the risk is high, they must plan as soon as possible an installation of the patches.
- If the risk is low they must schedule an update of Odoo which will be installed with the next release of the application.
- If the risk is low and no release installation is scheduled within a reasonable delay, they must schedule an update of Odoo.

The risk assessment depends on the situation of each project. Each *Project Manager* will have to evaluate the risk according to the nature of the vulnerability, the server exposure on Internet, etc .

Step 5: Deployment tracking of corrections

Who: *Project Manager*

After each patch deployment, the project manager will update the tracking document with,

- the date of application of the correction, and
- the current version of the application incorporating this patch.

Step 6: Tracking of deployment

who: pst

Progress monitoring will be reported in the tracking document (mentioned in step 1) until all projects have been patched.

5.4.3 Odoo migration guidelines

Anticipate migration

In the first project, keep in mind that your future self will need to migrate it.

Preparing the migration

Closing the migration

Update this page with lessons learned.

OTHER SUPPORT FUNCTIONS

6.1 QA Assistant

6.1.1 Scope

QA Assistant is an central role; he/she is responsible for overall development, implementation and maintenance of ACSONE Team Handbook.

6.1.2 Roles & Responsibilities

- Have a good understanding of the ACSONE Team Handbook in order to implement it.
- Validate that the ACSONE Team Handbook conforms to customer, internal, ISO 9001, and regulatory/legal requirements and inform the *Management Committee* about potential issues.
- Manage the monitoring, measurement, improvement and review of internal processes, especially those that affect the quality of the organizations products or services.
- Manage and promote the CAPA (corrective and preventive action) management system
- Perform statistical analysis, ie, track the records related to KPI or Acsone Quality indicators
 - Identify KPI and Acsone Quality Indicators to follow
 - Collect the identified records; in particular, organize customer surveys or internal audits
 - Compute the KPIs and follow their evolutions
- Support the management and the ACSONE Team for implementing ACSONE Team Handbook
 - Do the follow-up of the suggestions and modifications requests for the handbook (submitted Issues, Comments and Merge requests in *gitlab*). When necessary assign them to the appropriate person/role and/or create related CAPA
 - Present the ACSONE Team Handbook for new coming
 - Lead the team of internal auditors
 - Prepare the certification session
 - Conduct periodic management review meetings
- Special focus on the good working of customer surveys
 - Customer survey is a significant activity for ACSONE; it is also risky; *QA Assistant* has to take all the measures to guarantee the process efficiency.

6.1.3 Whos who

The QA Assistant is a horizontal role through the company. The job is done in conjunction with any department of the company that has an effect on the quality of the organizations products and services. He/She reports directly to the CFAO. This role is executed by smr.

6.1.4 Deliverables

- periodic Records Tracking Report, with:
 - customer surveys and KPI results
 - capa register

Overview

7.1 Roles

7.1.1 Role 1

Description: blah

Whos who:

Deliverables

7.1.2 Role 2

Description

Scope

Whos who:

Deliverables

7.2 Backup

Backup of internal resources is done using borgbackup, to a rsync.net server located in Switzerland.

HUMAN RESOURCES

This is the Human Resources corner it is under construction, please be patient

8.1 Onboarding

8.1.1 HR

For BE employees

- [] mobile phone Proximus Budget Mgr

For LU employees

- [] mobile phone

For contractors

- [] make sure we have a signed contract, archive it on the File Server
- []

8.1.2 Operational Briefing

- [] Guidelines to fill timesheets
- [] Security briefing (security and privacy by design)
- [] Inform about procedures (handbook, email of introduction)

8.1.3 ICT

For employees only

- [] Create GSuite account at <https://admin.google.com/acsone.eu/AdminHome> and send account information by email to the users private email address
- [] add him/her to the blog authors (<https://on.acsone.eu> in the Settings menu)
- [] create the user in the internal LDAP server: `smbldap-useradd -a -N 'gname' -S 'surname' 'trigram'`
- [] create the home directory on brufs/luxfs: `acsone-make-home-folder.sh`
- [] set the user e-mail address in JXplorer
- [] set the user in groups in JXplorer (ACSONE Staff and ACSONE VPN, plus any other relevant group)
- [] finish creating the user on bruds: `acsone_welcome_user` (we also have `acsone_welcome_external_user` in rare situations where we need to give a LDAP login to non employees)

- ☐ update phone list

For employees and contractors

- ☐ Add it to the relevant google groups (for employees, staff-be or staff-lu, plus any other group relevant for the function)
- ☐ Add it to the relevant Google Chat groups (Virtual Coffee Machine)
- ☐ Ask him/her to register on <https://acsone.plan.io> using his/her Google
- ☐ Add the new user to plan.io groups (Acsonestaff for employees, plus member of relevant projects)
- ☐ Ask him/her to register on <https://gitlab.acsone.eu>
- ☐ Add the new user to the relevant GitLab groups
 - ☐ Acsonestaff
 - ☐ Add as developer on the acsone/handbook project
 - ☐ Other?
- ☐ Ask him/her to register on github.com and communicate his/her github user id
- ☐ Add the GitHub user to the relevant GitHub teams

8.1.4 Delivery Assistant

- ☐ Create an Odoo account (for employees and contractors who need to enter timesheets in our Odoo)
 - ☐ create a partner (for employees only) address, acsone e-mail, mobile phone and bank account number
 - ☐ create a user (with both companies, groups ACSONE User (and ACSONE Employee unless consultant), department), use the partner address
 - ☐ create a product
 - ☐ create an employee (with partner as home address and acsone e-mail as work e-mail; for external collaborators, use their company as home address)
 - ☐ set product on employee the timesheet tab
 - ☐ create a hr contract, reflecting the hourly rate computed by HR
 - ☐ assign the user as member to 30 & 31 projects
 - ☐ create leave allocation

8.1.5 Newbie

- ☐ Send an email to staff-all@acsone.eu with a short introduction of him/herself : a couple of words on his/her background (studies/work experience), his/her title, the kind of project he/she will work on and a motto

8.2 Offboarding

8.2.1 HR

- [] Get Acsones assets back
 - [] laptop
 - [] badge
 - [] others (phone, docking, external storage,)
- [] Get customers assets back
 - [] badges
 - [] VPN hardware (tokens)
- [] company car checkout, keys returned
- [] sign the official documents and provide employee with the necessary administrative documents
- [] soon when the departure is known, send an email to staff-all@acsone.eu to announce it

8.2.2 ICT

For employees only

- [] GSuite / Google
 - [] suspend user
 - [] prefix email address with `suspended-`, so email is forwarded to the globally configured catchall address
 - [] remove all nicknames/aliases in Google Domain
 - [] click on RESET SIGN-IN COOKIES to terminate all gmail sessions
 - [] update phone list

For employees and contractors

- [] remove from google groups (not strictly necessary if it is an `@acsone.eu` address that has been suspended)
- [] remove from Google Chat groups
- [] lock user in <https://acsone.plan.io>
- [] remove from github teams at <https://github.com/orgs/acsone/teams>
- [] lock gitlab user
- [] Remove from all groups in LDAP (using JXplorer)
- [] Disable user in LDAP for samba and unix: on bruds: `sudo smbldap-usermod -L -I <uid>`
- [] rename home directories to `suspended-XXX` in `brufs/luxfs /data/homes` and remove symlinks in `/home`
- [] on `salt-master.local.acsone.eu`, in `/srv/pillar/local_users/user_info.sls`, add key disabled to user and run
 - `sudo salt '*' state.highstate whitelist=local_users`
 - `sudo salt '*' state.highstate whitelist=acsone_host_base`

8.2.3 Delivery Assistant

- ☐ remove from phone list
- ☐ In Odoo:
 - ☐ mark user and employee inactive
 - ☐ set the end-date in HR>Contract
- ☐ Handle the phone number switch between Acsones contract and personal contract

8.2.4 Account manager

- ☐ inform the customer as soon as possible and gather his feedback
- ☐ ensure that the customer receives its assets back

8.3 Training Feedback form

Each time you have followed a training (whatever the type), we would like to have your feedback. It will help Acsones to evaluate it and maybe recommend/propose it to others.

Ideally, please do it within one month after the training.

The feedback is done online and is [available here](#).

Many thanks for your cooperation.

COMMITTEES & MEETINGS

9.1 Whats Up

9.1.1 Meeting Frequency

Every 3 weeks, during lunch time.

9.1.2 Agenda

Since ACSONE is more and more a distributed company across several geographical locations, we came to the conclusion that coffee-machine conversations are not sufficient anymore for informal knowledge sharing. So this meeting was born to encourage active information sharing while remaining informal.

There is no specified format nor predefined agenda. Participant are expected to share news about their projects, interesting technologies or methodologies that have been used recently, etc. Colleagues willing to do short presentations 5-10 minutes max are most welcome to do so.

9.1.3 Members

All ACSONE employees and close collaborators are welcome to participate.

9.1.4 Meeting notes

In order to capture information shared during the meeting, notes can be taken in the What ' s Up room in *Google Chat*.

9.2 Teameetings

9.2.1 Meeting Frequency

Every 3 weeks, during lunch time or around 16h30.

9.2.2 Agenda

These meetings are a place to exchange information on dedicated topics. It is animated by Acsonone colleagues and close collaborators who wish to share something they learned in a semi-structured way.

Typical formats for this meeting include a round table on a pre-announced topic, or a presentation by a colleague followed by a Q&A session.

9.2.3 Members

All ACSONE employees and close collaborators are welcome to participate, and are encouraged to propose topics.

9.2.4 Meeting notes

In order to capture information shared during the meeting, notes can be taken in the What ' s Up room in *Google Chat*. A link to the slides, if any, should be posted in the chat room, as well as on the *Internal Blog*.

9.3 Management Committee

9.3.1 Meeting Frequency

Monthly.

9.3.2 Agenda

Monthly

- Review and update the *risk register*. Followup on actions.
- Review status of ressource allocation, hiring process.

Quarterly

- Review Customer Activity Reports from *Account Managers*.
- Review progress of key feedback processes:
 - *Customer Appraisal*,
 - Internal Audit,
 - content and followup on feedback module in *Odoo*.

Todo: clarify how CAPA are managed (issues in the handbook, or the feedback module, or both)

Yearly

- Validate marketing and communication plan.
- ISO Management Review.

Todo: link to management review document template

9.3.3 Members

The owner and organiser of the meeting is phf.

Members are ccs, jcc, jpd, phf, sbi.

9.4 Sales Decision Committee

9.4.1 Meeting Frequency

On a ad-hoc basis. In general decisions of this committee are made off-line, by e-mail.

9.4.2 Agenda

- Go/Nogo decisions in the context of the *Bid Procedure*.
- Follow-up current offers status when needed.

9.4.3 Members

Members are *Account Managers*, *Business Development Officers*, relevant *Solution Owners*.

Opportunities involving technologies that are unusual for Acson e are discussed with the *CTO*.

Opportunities involving a significant risk on resources (because they are unusually big or involve particularly strict planning constraints) are discussed with the *HR Allocation Owner*.

Other participants may be invited on as needed.

9.5 Board

9.5.1 Meeting Frequency

Quarterly.

9.5.2 Agenda

-

9.5.3 Members

The organiser is phf.

The president is edf.

The secretary is designated at the beginning of the meeting.

Participants are all Acstone board members.

9.6 Shareholders

9.6.1 Meeting Frequency

The Annual General Meeting takes place on a yearly basis every last Wednesday of April as defined in Acstones incorporation deed.

Extraordinary General Meetings may be convened when special decisions need to be submitted to the vote of shareholders.

9.6.2 Agenda of the Ordinary Annual General Meeting

- Approval of the Board Management Report
- Approval of Acstones annual accounts, as established after allocation of the annual results
- Give discharge to the Directors

The agenda of the Extraordinary General Meetings depends on its special content as sent beforehand to the Shareholders as defined by law and in Acstones incorporation deed.

9.6.3 Members

The organiser of the meeting is phf.

Participants are all Acstone shareholders.

HOW TO CONTRIBUTE

10.1 Text format

This text is written in a format named reStructuredText, which is then automatically converted to the document you are reading¹.

Here is a nice [introduction](#) about it. Read it first, its short and youll be glad you did.

In addition to standard reStructuredText and Sphinx constructs, we have a few one specific to this document.

acsrole

To mark the place where a role is defined, for example:

```
.. acsrole:: Dolphin
```

Dolphin

Dolphins are the second most intelligent creatures
on Earth, above humans and below mice.

To reference a role in the text, for example:

¹ this conversion occurs using a tool named [Sphinx](#).

```
The last ever :acsrole:`Dolphin` message was misinterpreted
as an attempt to do a double-backward somersault
through a hoop while whistling "The Star-Spangled
Banner," but the message was actually: So long and
thanks for all the fish.
```

acsproc

To mark a place where a procedure or work instruction is defined or referenced.

acscom

To mark a place where a Committee is defined or referenced.

acsapp

To mark the place where an application is defined, for example:

```
.. acsapp:: theguide
```

Hitchhiker's Guide

The Guide is described as resembling "a small, thin, flexible lap computer" encased in a "sturdy plastic cover" with the words "Don't Panic" inscribed on it "in large, friendly letters".

To reference an application in the text, for example:

```
Despite the work of dedicated field researchers such as
Ford Prefect, many of the contributions to
:acsapp:`the Guide <theguide>` are made on a strictly
ad-hoc basis
```

acsstaff

To reference a named staff member, use :acsstaff:`trigram`.

10.2 Repository

There are 2 manners to contribute to the handbook:

- For small improvements you can edit the file and issue a merge request directly from the handbook website using the link Edit in repository;
- For more regular or important contributions it might be more comfortable to work locally and issue a merge request in GitLab when everything is ready. In order to be able to work locally, read the following sections.

10.2.1 Installation of the Git related tools

In order to be able to update files on your computer and push some changes to GitLab you will need to install the following tools:

On Windows:

- Install Git (see <https://git-scm.com/download/win>);
- Install TortoiseGit (see <https://tortoisegit.org/download/>);

10.2.2 Get the handbook source files on your computer

The first time, you have to clone the Git repository:

- Be sure that you have a GitLab account and that your public key (file .pub) is registered on this account;
- Create a working folder on your computer;
- Within this folder, right-click and select *Git Clone*;
- Specify the address of the repository (`git@gitlab.acsone.eu:acsone/handbook.git`);
- Check Load putty key and choose your private key (ppk file);
- Click Ok. This creates a copy of the repository on your computer

10.2.3 Issue a request to update the handbook

All update requests will be reviewed by a Quality Manager before being merged and published as a new official version.

In order to make a consistent set of changes, you have to create a branch.

In our case, the branch is always based on master (we start our modification basing upon the current official version).

To do this,

- Right-click on the handbook directory and choose *TortoiseGit -> Create Branch*. Choose your branch name and confirm.
- Right-click on the handbook directory and choose *TortoiseGit -> Switch to branch*. Choose your newly created branch and confirm.

Now you are working in your own branch (nobody else should use this branch).

You can now modify or create files.

Regularly, you can *Commit* and *Push* changes to your branch:

- Right-click on the handbook directory and choose *Git Commit -> your-branch-name* (if you see `master`, it means that you didnt switch to the correct branch);

Commit is simply used to document your updates on your local version of the branch. Nothing is pushed to the GitLab server.

When you want to update GitLab (your branch), then you Push the changes:

- Right-click on the handbook directory and choose *Tortoise Git -> Push*

This actions will simply upload your modifications to GitLab, without any impact on the official version or the review process.

When you think that the version that you have should be reviewed and thereafter included within the official version, then you have to issue a Merge Request:

- Connect to GitLab (<https://gitlab.acsone.eu/acsone/handbook>)
- The branch that youve just pushed should appear on the top of the page with a message You pushed your-branch x minutes ago
- Click on the Create merge request, fill the form and confirm.

Your merge request will be analyzed by a Quality Manager, but should already been visible in a preview environment. A link to this environment appears on your merge request (if the build succeeded).

10.2.4 Build a local version of the handbook

If you are a major contributor, it might be easier to be able to generate a local copy of the handbook HTML rendering.

In order to do this you need to install Python36, the pip package and the Sphinx package.

- Install Python 3.6 (choose c:\softs\python\python36 as installation directory for example)
- Add c:\softs\python\python36 to the PATH environment variable (Windows -> Edit the system environment variables)
- Add c:\softs\python\python36\scripts to the PATH environment variable
- Launch a command prompt and run `pip install sphinx`, then `pip install setuptools_scm`

Thereafter you are able to generate a local HTML version of the handbook:

- Open a command prompt and go to the handbook root directory;
- Execute `make html`

This creates a directory `_build\html` that contains the HTML version of the handbook. Click on `index.html` to open the home page of the handbook.

INDICES AND TABLES

- `genindex`
- `search`
